"Debugging" Specialists | www.acsolutions.co.za

Digital Forensics is considered to be the use of analytical and investigative techniques to identify, collect, examine and preserve evidence which is digitally stored. Every organisation will eventually deal with cyber-crime. Fraud, intrusion, insider threat, phishing and other cyber-crimes are now a fact of life

Your privacy and peace of mind can be very easily compromised. Technical Surveillance counter measure also acknowledged as "TSCM" is one of the most significant service a corporation can offer their customer. Can you envision if the rival is able to eavesdrop, watch and identify you're every move?

Now a days everyone can purchase a spy bug and start stalking you without any detection. Our skilled "TSCM" investigators can instantaneously detect all spy bugs, spy devices and spy equipment and will conduct a very technical counter measure that is performed to disable the spy bugs, spy devices and spy equipment.

We have witnessed a remarkable change in the way people universally use technology to go about their daily undertakings. Today's individual uses their smartphone to book plane tickets, make payments and even control their home from their whereabouts. As we enter a new year more and more individuals depend on their mobile devices to conduct their daily existence. As we become more reliant on our devices the requirement for digital forensics grows. Therefore we have fostered the development of techniques and proprietary software that allows our forensic investigator to probe and recover the relevant information even when other companies would consider the information unrecoverable.

ACS would like to provide you with outstanding services to ensure safe retention of your company's Trade Secrets and Intellectual Property (IP) which will leave your business with complete peace of mind in 2016.
